

18Mb Pipelined QDR™II SRAM Burst of 2

**Advance
Information**
IDT71P72204
IDT71P72104
IDT71P72804
IDT71P72604

Features

- ◆ 18Mb Density (2Mx8, 2Mx9, 1Mx18, 512kx36)
- ◆ Separate, Independent Read and Write Data Ports
 - Supports concurrent transactions
- ◆ Dual Echo Clock Output
- ◆ 2-Word Burst on all SRAM accesses
- ◆ DDR (Double Data Rate) Multiplexed Address Bus
 - One Read and One Write request per clock cycle
- ◆ DDR (Double Data Rate) Data Buses
 - Two word burst data per clock on each port
 - Four word transfers per clock cycle (2 word bursts on 2 ports)
- ◆ Depth expansion through Control Logic
- ◆ HSTL (1.5V) inputs that can be scaled to receive signals from 1.4V to 1.9V.
- ◆ Scalable output drivers
 - Can drive HSTL, 1.8V TTL or any voltage level from 1.4V to 1.9V.
 - Output Impedance adjustable from 35 ohms to 70 ohms
- ◆ 1.8V Core Voltage (VDD)
- ◆ 165-ball, 1.0mm pitch, 13mm x 15mm fBGA Package
- ◆ JTAG Interface

Description

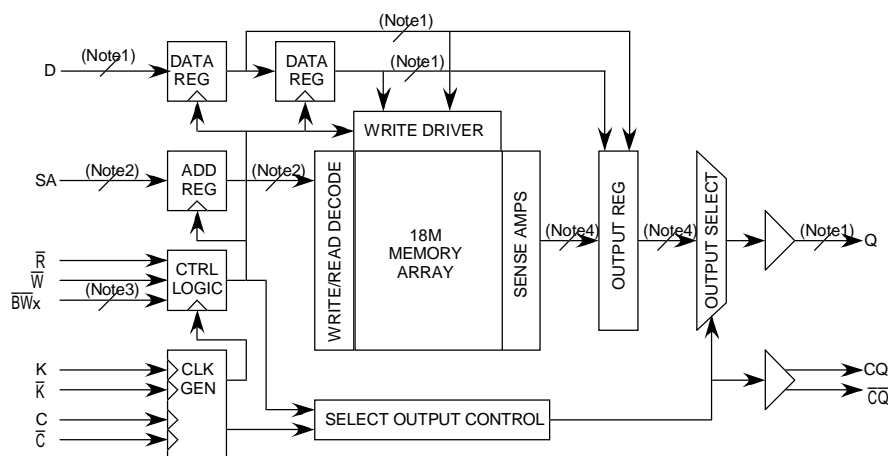

The IDT QDRII™ Burst of two SRAMs are high-speed synchronous memories with independent, double-data-rate (DDR), read and write data ports. This scheme allows simultaneous read and write access for the maximum device throughput, with two data items passed with each read or write. Four data word transfers occur per clock cycle, providing quad-data-rate (QDR) performance. Comparing this with standard SRAM common I/O (CIO), single data rate (SDR) devices, a four to one increase in data access is achieved at equivalent clock speeds. Considering that QDRII allows clock speeds in excess of standard SRAM devices, the throughput can be increased well beyond four to one in most applications.

Using independent ports for read and write data access, simplifies system design by eliminating the need for bi-directional buses. All buses associated with the QDRII are unidirectional and can be optimized for signal integrity at very high bus speeds. The QDRII has scalable output impedance on its data output bus and echo clocks, allowing the user to tune the bus for low noise and high performance.

The QDRII has a single DDR address bus with multiplexed read and write addresses. All read addresses are received on the first half of the clock cycle and all write addresses are received on the second half of the clock cycle. The read and write enables are received on the first half of the clock cycle. The byte and nibble write signals are received on both halves of the clock cycle simultaneously with the data they are controlling on the data input bus.

The QDRII has echo clocks, which provide the user with a clock

Functional Block Diagram

Notes

- 1) Represents 8 data signal lines for x8, 9 signal lines for x9, 18 signal lines for x18, and 36 signal lines for x36
- 2) Represents 20 address signal lines for x8 and x9, 19 address signal lines for x18, and 18 address signal lines for x36.
- 3) Represents 1 signal line for x9, 2 signal lines for x18, and four signal lines for x36. On x8 parts, the \overline{BW} is a "nibble write" and there are 2 signal lines.
- 4) Represents 16 data signal lines for x8, 18 signal lines for x9, 36 signal lines for x18, and 72 signal lines for x36.

MAY 2004

that is precisely timed to the data output, and tuned with matching impedance and signal quality. The user can use the echo clock for downstream clocking of the data. Echo clocks eliminate the need for the user to produce alternate clocks with precise timing, positioning, and signal qualities to guarantee data capture. Since the echo clocks are generated by the same source that drives the data output, the relationship to the data is not significantly affected by voltage, temperature and process, as would be the case if the clock were generated by an outside source.

All interfaces of the QDR II SRAM are HSTL, allowing speeds beyond SRAM devices that use any form of TTL interface. The interface can be scaled to higher voltages (up to 1.9V) to interface with 1.8V systems if necessary. The device has a V_{DDQ} and a separate V_{ref} , allowing the user to designate the interface operational voltage, independent of the device core voltage of 1.8V V_{DD} . The output impedance control allows the user to adjust the drive strength to adapt to a wide range of loads and transmission lines.

The device is capable of sustaining full bandwidth on both the input and output ports simultaneously. All data is in two word bursts, with addressing capability to the burst level.

Clocking

The QDR II SRAM has two sets of input clocks, namely the K , \bar{K} clocks and the C , \bar{C} clocks. In addition, the QDR II has an output "echo" clock, CQ , \bar{CQ} .

The K and \bar{K} clocks are the primary device input clocks. The K clock is, used to clock in the control signals (\bar{R} , \bar{W} and BWx or NWx), the read address, and the first word of the data burst during a write operation. The \bar{K} clock is used to clock in the control signals (BWx or NWx), write address and the second word of the data burst during a write operation. The K and \bar{K} clocks are also used internally by the SRAM. In the event that the user disables the C and \bar{C} clocks, the K and \bar{K} clocks will also be used to clock the data out of the output register and generate the echo clocks.

The C and \bar{C} clocks may be used to clock the data out of the output register during read operations and to generate the echo clocks. C and \bar{C} must be presented to the SRAM within the timing tolerances. The output data from the QDR II will be closely aligned to the C and \bar{C} input, through the use of an internal DLL. When C is presented to the QDR II SRAM, the DLL will have already internally clocked the first data word to arrive at the device output simultaneously with the arrival of the C clock. The \bar{C} and second data word of the burst will also correspond.

Single Clock Mode

The QDR II SRAM may be operated with a single clock pair. C and \bar{C} may be disabled by tying both signals high, forcing the outputs and echo clocks to be controlled instead by the K and \bar{K} clocks.

DLL Operation

The DLL in the output structure of the QDR II SRAM can be used to closely align the incoming clocks C and \bar{C} with the output of the data, generating very tight tolerances between the two. The user may disable the DLL by holding \bar{Doff} low. With the DLL off, the C and \bar{C} (or K and \bar{K} if C and \bar{C} are not used) will directly clock the output register of the SRAM. With the DLL off, there will be a propagation delay from the time the clock enters the device until the data appears at the output.

Echo Clock

The echo clocks, CQ and \bar{CQ} , are generated by the C and \bar{C} clocks (or K , \bar{K} if C , \bar{C} are disabled). The rising edge of C generates the rising edge of CQ , and the falling edge of \bar{CQ} . The rising edge of \bar{C} generates the rising edge of \bar{CQ} and the falling edge of CQ . This scheme improves the correlation of the rising and falling edges of the echo clock and will improve the duty cycle of the individual signals.

The echo clock is very closely aligned with the data, guaranteeing that the echo clock will remain closely correlated with the data, within the tolerances designated.

Read and Write Operations

QDR II devices internally store the two words of the burst as a single, wide word and will retain their order in the burst. There is no ability to address to the single word level or reverse the burst order; however, the byte and nibble write signals can be used to prevent writing any individual bytes, or combined to prevent writing one word of the burst.

Read operations are initiated by holding the read port select (\bar{R}) low, and presenting the read address to the address port during the rising edge of K which will latch the address. The data will then be read and will appear at the device output at the designated time in correspondence with the C and \bar{C} clocks.

Write operations are initiated by holding the write port select (\bar{W}) low and designating with the Byte Write inputs (BWx) which bytes are to be written (or NWx on x8 devices). The first word of the data must also be present on the data input bus $D[X:0]$. Upon the rising edge of K the first word of the burst will be latched into the input register. After K has risen, and the designated hold times observed, the second half of the clock cycle is initiated by presenting the write address to the address bus $SA[X:0]$, the BWx (or NWx) inputs for the second data word of the burst, and the second data item of the burst to the data bus $D[X:0]$. Upon the rising edge of \bar{K} , the second word of the burst will be latched, along with the designated address. Both the first and second words of the burst will then be written into memory as designated by the address and byte write enables.

Output Enables

The QDR II SRAM automatically enables and disables the $Q[X:0]$ outputs. When a valid read is in progress, and data is present at the output, the output will be enabled. If no valid data is present at the output (read not active), the output will be disabled (high impedance). The echo clocks will remain valid at all times and cannot be disabled or turned off. During power-up the Q outputs will come up in a high impedance state.

Programmable Impedance

An external resistor, RQ , must be connected between the ZQ pin on the SRAM and V_{SS} to allow the SRAM to adjust its output drive impedance. The value of RQ must be 5X the value of the intended drive impedance of the SRAM. The allowable range of RQ to guarantee impedance matching with a tolerance of $\pm 10\%$ is between 175 ohms and 350 ohms, with $V_{DDQ} = 1.5V$. The output impedance is adjusted every 1024 clock cycles to correct for drifts in supply voltage and temperature. If the user wishes to drive the output impedance of the SRAM to its lowest value, the ZQ pin may be tied to V_{DDQ} .

Pin Definitions

Symbol	Pin Function	Description
D[X:0]	Input Synchronous	Data input signals, sampled on the rising edge of K and \bar{K} clocks during valid write operations 2M x 8 -- D[7:0] 2M x 9 -- D[8:0] 1M x 18 -- D[17:0] 512K x 36 -- D[35:0]
$\bar{B}W_0$, $\bar{B}W_1$ $\bar{B}W_2$, $\bar{B}W_3$	Input Synchronous	Byte Write Select 0, 1, 2, and 3 are active LOW. Sampled on the rising edge of the K and again on the rising edge of \bar{K} clocks during write operations. Used to select which byte is written into the device during the current portion of the write operations. Bytes not written remain unaltered. All the byte writes are sampled on the same edge as the data. Deselecting a Byte Write Select will cause the corresponding byte of data to be ignored and not written in to the device. 2M x 9 -- $\bar{B}W_0$ controls D[8:0] 1M x 18 -- $\bar{B}W_0$ controls D[8:0] and $\bar{B}W_1$ controls D[17:9] 512K x 36 -- $\bar{B}W_0$ controls D[8:0], $\bar{B}W_1$ controls D[17:9], $\bar{B}W_2$ controls D[26:18] and $\bar{B}W_3$ controls D[35:27]
$\bar{N}W_0$, $\bar{N}W_1$	Input Synchronous	Nibble Write Select 0 and 1 are active LOW. Available only on x8 bit parts instead of Byte Write Selects. Sampled on the rising edge of the K and \bar{K} clocks during write operations. Used to select which nibble is written into the device during the current portion of the write operations. Nibbles not written remain unaltered. All the nibble writes are sampled on the same edge as the data. Deselecting a Nibble Write Select will cause the corresponding nibble of data to be ignored and not written in to the device.
SA	Input Synchronous	Address Inputs. Read addresses are sampled on the rising edge of K clock during active read operations. Write addresses are sampled on the rising edge of \bar{K} clock during active write operations. These address inputs are multiplexed, so that both a read and write operation can occur on the same clock cycle. These inputs are ignored when the appropriate port is deselected.
Q[X:0]	Output Synchronous	Data Output signals. These pins drive out the requested data during a Read operation. Valid data is driven out on the rising edge of both the C and \bar{C} clocks during Read operations or K and \bar{K} when operating in single clock mode. When the Read port is deselected, Q[X:0] are automatically three-stated.
\bar{W}	Input Synchronous	Write Control Logic active Low. Sampled on the rising edge of the positive input clock (K). When asserted active, a write operation is initiated. Deasserting will deselect the Write port. Deselecting the Write port will cause D[X:0] to be ignored.
\bar{R}	Input Synchronous	Read Control Logic, active LOW. Sampled on the rising edge of Positive Input Clock (K). When active, a Read operation is initiated. Deasserting will cause the Read port to be deselected. When deselected, the pending access is allowed to complete and the output drivers are automatically three-stated following the next rising edge of the C clock. Each read access consists of a burst of two sequential transfer.
C	Input Clock	Positive Output Clock Input. C is used in conjunction with \bar{C} to clock out the Read data from the device. C and \bar{C} can be used together to deskew the flight times of various devices on the board back to the controller. See application example for further details.
\bar{C}	Input Clock	Negative Output Clock Input. \bar{C} is used in conjunction with C to clock out the Read data from the device. C and \bar{C} can be used together to deskew the flight times of various devices on the board back to the controller. See application example for further details.
K	Input Clock	Positive Input Clock Input. The rising edge of K is used to capture synchronous inputs to the device and to drive out data through Q[X:0] when in single clock mode. All accesses are initiated on the rising edge of K.
\bar{K}	Input Clock	Negative Input Clock Input. \bar{K} is used to capture synchronous inputs being presented to the device and to drive out data through Q[X:0] when in single clock mode.
CQ, $\bar{C}Q$	Output Clock	Synchronous Echo clock outputs. The rising edges of these outputs are tightly matched to the synchronous data outputs and can be used as a data valid indication. These signals are free running and do not stop when the output data is tri-stated.
ZQ	Input	Output Impedance Matching Input. This input is used to tune the device outputs to the system data bus impedance. Q[X:0] output impedance is set to $0.2 \times RQ$, where RQ is a resistor connected between ZQ and ground. Alternately, this pin can be connected directly to V_{DDQ} , which enables the minimum impedance mode. This pin cannot be connected directly to GND or left unconnected.

Pin Definitions continued

Symbol	Pin Function	Description
$\overline{\text{Doff}}$	Input	DLL Turn Off. When low this input will turn off the DLL inside the device. The AC timings with the DLL turned off will be different from those listed in this data sheet. There will be an increased propagation delay from the incidence of C and $\overline{\text{C}}$ to Q, or K and $\overline{\text{K}}$ to Q as configured. The propagation delay is not a tested parameter, but will be similar to the propagation delay of other SRAM devices in this speed grade.
TDO	Output	TDO pin for JTAG
TCK	Input	TCK pin for JTAG.
TDI	Input	TDI pin for JTAG. An internal resistor will pull TDI to VDD when the pin is unconnected.
TMS	Input	TMS pin for JTAG. An internal resistor will pull TMS to VDD when the pin is unconnected.
NC	No Connect	No connects inside the package. Can be tied to any voltage level
VREF	Input Reference	Reference Voltage input. Static input used to set the reference level for HSTL inputs and Outputs as well as AC measurement points.
VDD	Power Supply	Power supply inputs to the core of the device. Should be connected to a 1.8V power supply.
VSS	Ground	Ground for the device. Should be connected to ground of the system.
VDDQ	Power Supply	Power supply for the outputs of the device. Should be connected to a 1.5V power supply for HSTL or scaled to the desired output voltage.

Absolute Maximum Ratings^{(1) (2)}

Symbol	Rating	Value	Unit
V _{TERM}	Supply Voltage on V _{DD} with Respect to GND	-0.5 to +2.9	V
V _{TERM}	Supply Voltage on V _{DDQ} with Respect to GND	-0.5 to V _{DD} + 0.3	V
V _{TERM}	Voltage on Input terminals with respect to GND.	-0.5 to V _{DD} + 0.3	V
V _{TERM}	Voltage on Output and I/O terminals with respect to GND.	-0.5 to V _{DDQ} + 0.3	V
T _{BIAS}	Temperature Under Bias	-55 to +125	°C
T _{STG}	Storage Temperature	-65 to +150	°C
I _{OUT}	Continuous Current into Outputs	± 20	mA

NOTES:

6109 tbl 05

- Stresses greater than those listed under ABSOLUTE MAXIMUM RATINGS may cause permanent damage to the device. This is a stress rating only and functional operation of the device at these or any other conditions above those indicated in the operational sections of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect reliability.
- V_{DDQ} must not exceed V_{DD} during normal operation.

Capacitance (T_A = +25°C, f = 1.0MHz)⁽¹⁾

Symbol	Parameter	Conditions	Max.	Unit
C _{IN}	Input Capacitance	V _{DD} = 1.8V V _{DDQ} = 1.5V	5	pF
C _{CLK}	Clock Input Capacitance		6	pF
C _O	Output Capacitance		7	pF

6109 tbl 06

NOTE:

- Tested at characterization and retested after any design or process change that may affect these parameters.

Recommended DC Operating and Temperature Conditions

Symbol	Parameter	Min.	Typ.	Max.	Unit
V _{DD}	Power Supply Voltage	1.7	1.8	1.9	V
V _{DDQ}	I/O Supply Voltage	1.4	1.5	1.9	V
V _{SS}	Ground	0	0	0	V
V _{REF}	Input Reference Voltage	0.68	V _{DDQ} /2	0.95	V
T _A	Ambient Temperature ⁽¹⁾	0	25	+70	°C

NOTE:

6109 tbl 04

- During production testing, the case temperature equals the ambient temperature.

Write Descriptions^(1,2)

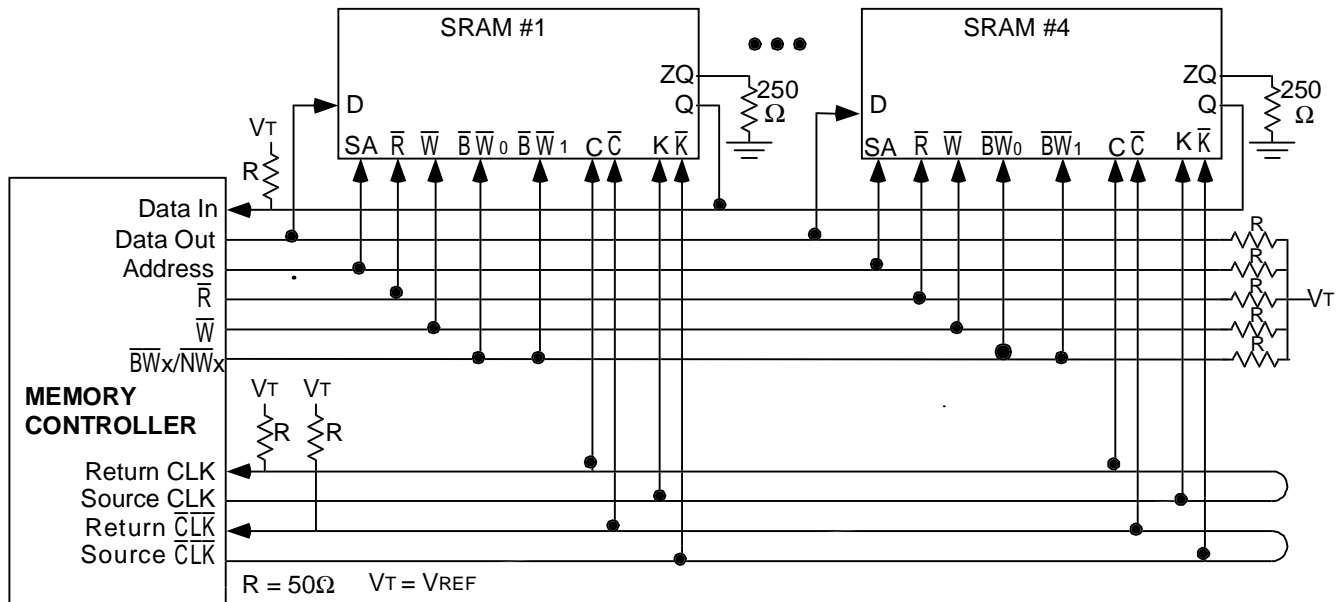

Signal	\overline{BW}_0	\overline{BW}_1	\overline{BW}_2	\overline{BW}_3	\overline{NW}_0	\overline{NW}_1
Write Byte 0	L	X	X	X	X	X
Write Byte 1	X	L	X	X	X	X
Write Byte 2	X	X	L	X	X	X
Write Byte 3	X	X	X	L	X	X
Write Nibble 0	X	X	X	X	L	X
Write Nibble 1	X	X	X	X	X	L

6109 tbl 09

NOTES:

- All byte write (\overline{BW}_x) and nibble write (\overline{NW}_x) signals are sampled on the rising edge of K and again on \overline{K} . The data that is present on the data bus in the designated byte/nibble will be latched into the input if the corresponding \overline{BW}_x or \overline{NW}_x is held low. The rising edge of K will sample the first byte/nibble of the two word burst and the rising edge of \overline{K} will sample the second byte/nibble of the two word burst.
- The availability of the \overline{BW}_x or \overline{NW}_x on designated devices is described in the pin description table.
- The QDR II Burst of two SRAM has data forwarding. A read request that is initiated on the same cycle as a write request to the same address will produce the newly written data in response to the read request.

Application Example

6109 drw 20

DC Electrical Characteristics Over the Operating Temperature and Supply Voltage Range ($V_{DD} = 1.8 \pm 100\text{mV}$, $V_{DDQ} = 1.4\text{V}$ to 1.9V)

Parameter	Symbol	Test Conditions	Min	Max	Unit	Note
Input Leakage Current	I_{IL}	$V_{DD} = \text{Max } V_{IN} = V_{SS} \text{ to } V_{DDQ}$	-10	+10	μA	
Output Leakage Current	I_{OL}	Output Disabled	-10	+10	μA	
Operating Current (x36,x18,x9,x8): DDR	I_{DD}	$V_{DD} = \text{Max}$, $I_{OUT} = 0\text{mA}$ (outputs open), Cycle Time $\geq 1\text{KHKH Min}$	250MHZ	-	TBD	mA 1
			200MHZ	-	TBD	
			167MHZ	-	TBD	
Standby Current: NOP	I_{SB1}	Device Deselected (in NOP state), $I_{out} = 0\text{mA}$ (outputs open), $f = \text{Max}$, All Inputs $\leq 0.2\text{V}$ or $\geq V_{DD} - 0.2\text{V}$	250MHZ	-	TBD	mA 2
			200MHZ	-	TBD	
			167MHZ	-	TBD	
Output High Voltage	V_{OH1}	$R_Q = 250\Omega$, $I_{OH} = -15\text{mA}$	$V_{DDQ}/2 - 0.12$	$V_{DDQ}/2 + 0.12$	V	3,7
Output Low Voltage	V_{OL1}	$R_Q = 250\Omega$, $I_{OL} = 15\text{mA}$	$V_{DDQ}/2 - 0.12$	$V_{DDQ}/2 + 0.12$	V	4,7
Output High Voltage	V_{OH2}	$I_{OH} = -0.1\text{mA}$	$V_{DDQ} - 0.2$	V_{DDQ}	V	5
Output Low Voltage	V_{OL2}	$I_{OL} = 0.1\text{mA}$	V_{SS}	0.2	V	6

6109 tbl 10c

NOTES:

- Operating Current is measured at 100% bus utilization.
- Standby Current is only after all pending read and write burst operations are completed.
- Outputs are impedance-controlled. $I_{OH} = -(V_{DDQ}/2)/(R_Q/5)$ and is guaranteed by device characterization for $175\Omega \leq R_Q < 350\Omega$. This parameter is tested at $R_Q = 250\Omega$, which gives a nominal 50Ω output impedance.
- Outputs are impedance-controlled. $I_{OL} = (V_{DDQ}/2)/(R_Q/5)$ and is guaranteed by device characterization for $175\Omega \leq R_Q < 350\Omega$. This parameter is tested at $R_Q = 250\Omega$, which gives a nominal 50Ω output impedance.
- This measurement is taken to ensure that the output has the capability of pulling to the V_{DDQ} rail, and is not intended to be used as an impedance measurement point.
- This measurement is taken to ensure that the output has the capability of pulling to V_{SS} , and is not intended to be used as an impedance measurement point.
- Programmable Impedance Mode.

Input Electrical Characteristics Over the Operating Temperature and Supply Voltage Range ($V_{DD} = 1.8 \pm 100\text{mV}$, $V_{DDQ} = 1.4\text{V to } 1.9\text{V}$)

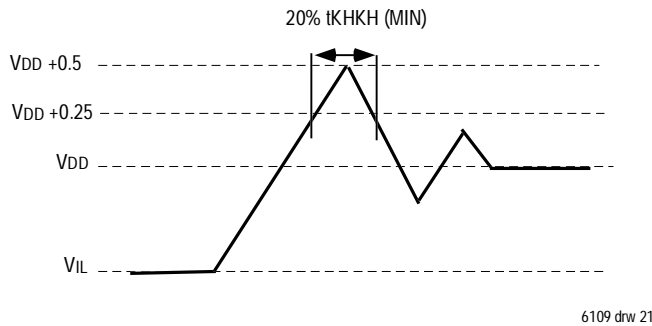

PARAMETER	SYMBOL	MIN	MAX	UNIT	NOTES
Input High Voltage, DC	$V_{IH} \text{ (DC)}$	$V_{REF} + 0.1$	$V_{DDQ} + 0.3$	V	1,2
Input Low Voltage, DC	$V_{IL} \text{ (DC)}$	-0.3	$V_{REF} - 0.1$	V	1,3
Input High Voltage, AC	$V_{IH} \text{ (AC)}$	$V_{REF} + 0.2$	-	V	4,5
Input Low Voltage, AC	$V_{IL} \text{ (AC)}$	-	$V_{REF} - 0.2$	V	4,5

NOTES:

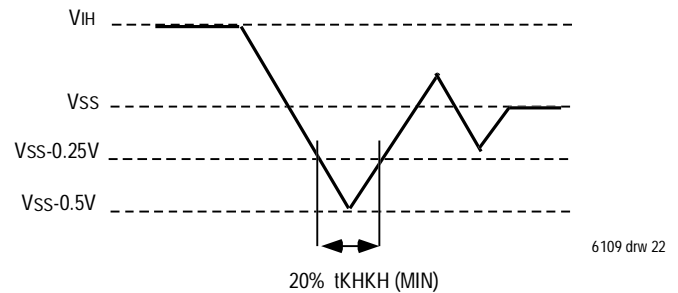

6109 tbl 10d

- These are DC test criteria. DC design criteria is $V_{REF} \pm 50\text{mV}$. The AC V_{IH}/V_{IL} levels are defined separately for measuring timing parameters.
- $V_{IH} \text{ (Max) DC} = V_{DDQ} + 0.3$, $V_{IH} \text{ (Max) AC} = V_{DD} + 0.5\text{V}$ (pulse width $\leq 20\% \text{ t}_{KHK}$ (min))
- $V_{IL} \text{ (Min) DC} = -0.3\text{V}$, $V_{IL} \text{ (Min) AC} = -0.5\text{V}$ (pulse width $\leq 20\% \text{ t}_{KHK}$ (min))
- This condition is for AC function test only, not for AC parameter test.
- To maintain a valid level, the transitioning edge of the input must:
 - Sustain a constant slew rate from the current AC level through the target AC level, $V_{IL} \text{ (AC)}$ or $V_{IH} \text{ (AC)}$
 - Reach at least the target AC level.
 - After the AC target level is reached, continue to maintain at least the target DC level, $V_{IL} \text{ (DC)}$ or $V_{IH} \text{ (DC)}$

6109 1b1 11

NOTES:

- Cycle to cycle period jitter is the variance from clock rising edge to the next expected clock rising edge, as defined per JEDEC Standard No.65 (EIA/JESD65) pg.10
- V_{dd} slew rate must be less than 0.1V DC per 50 ns for DLL lock retention. DLL lock time begins once V_{dd} and input clock are stable.
- If C, \overline{C} are tied High, K, \overline{K} become the references for C, \overline{C} timing parameters.
- To avoid bus contention, at a given voltage and temperature t_{CHQX1} is bigger than t_{CHQZ}.
The specs as shown do not imply bus contention because t_{CHQX1} is a MIN parameter that is worse case at totally different test conditions (0°C, 1.9V) than t_{CHQZ}, which is a MAX parameter (worst case at 70°C, 1.7V)
It is not possible for two SRAMs on the same board to be at such different voltage and temperature.
- This parameter is guaranteed by device characterization, but not production tested.
- All address inputs must meet the specified setup and hold times for all latching clock edges.
- Control signals are \overline{R} , \overline{W} , $\overline{BW_0}$, $\overline{BW_1}$ and ($\overline{NW_0}$, $\overline{NW_1}$, for x8) and ($\overline{BW_2}$, $\overline{BW_3}$ also for x36)
- During production testing, the case temperature equals T_A.
- Clock High Time (t_{KHKL}) and Clock Low Time (t_{KLKH}) should be within 40% to 60% of the cycle time (t_{KHKH}).
- Clock to $\overline{\text{Clock}}$ time (t_{KH \overline{K} H}) and $\overline{\text{Clock}}$ to Clock time (t $\overline{\text{K}}$ HKH) should be within 45% to 55% of the cycle time (t_{KHKH}).

The diagram illustrates the timing relationships for the 6109 device across 10 clock cycles. The signals and their timing parameters are as follows:

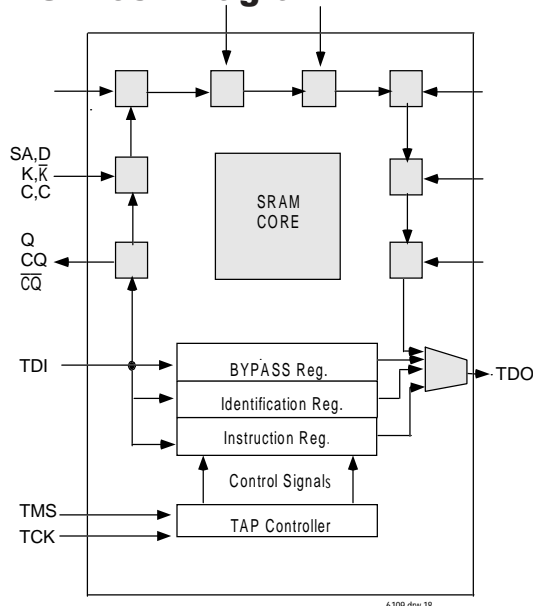

- SA (Address):** Shows address bits A0 through A6. Setup time t_{AVKH} and hold time t_{KHAX} are indicated relative to the clock.
- D (Data):** Shows data bits D10 through D61. Setup time t_{DVKH} and hold time t_{KHDX} are indicated relative to the clock.
- Q (Data):** Shows data bits Q00 through Q41. Setup time t_{CHQX1} and hold time t_{CHQX} are indicated relative to the clock. Additional timing parameters t_{CHQV} and t_{CHQV1} are shown for specific data bits.
- C (Clock):** The primary clock signal with period t_{KHKL} and t_{KLKH} .
- CQ (Clock Enable):** A signal that enables the clock. Setup time t_{CHCOV} and hold time t_{CHCOX} are indicated relative to the clock.
- CQ-bar (Clock Enable Inverted):** The inverted clock enable signal.

The diagram also shows the timing of the \bar{R} (Reset) and \bar{W} (Write Enable) signals, which are active-low. The \bar{K} (Clock Enable Inverted) signal is also shown, which is active-low.

IEEE 1149.1 TEST ACCESS PORT AND BOUNDARY SCAN-JTAG

This part contains an IEEE standard 1149.1 Compatible Test Access Port (TAP). The package pads are monitored by the Serial Scan circuitry when in test mode. This is to support connectivity testing during manufacturing and system diagnostics. In conformance with IEEE 1149.1, the SRAM contains a TAP controller, Instruction register, Bypass Register and ID register. The TAP controller has a standard 16-state machine that resets internally upon power-up; therefore, the TRST signal is not required. It is possible to use this device without utilizing the TAP. To disable the TAP controller without interfacing with normal operation of the SRAM, TCK must be tied to Vss to preclude a mid level input. TMS and TDI are designed so an undriven input will produce a response identical to the application of a logic 1, and may be left unconnected, but they may also be tied to VDD through a resistor. TDO should be left unconnected.

JTAG Block Diagram

JTAG Instruction Coding

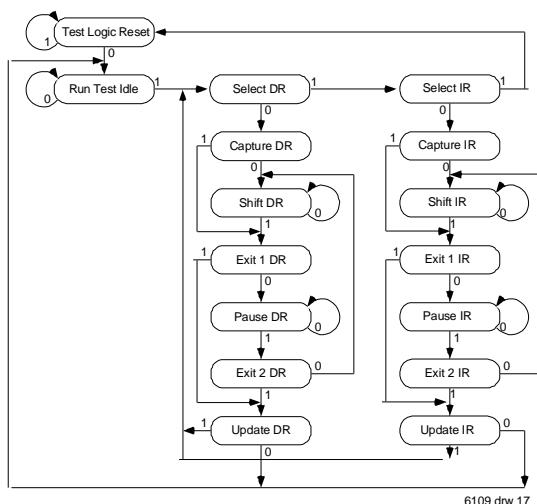

IR2	IR1	IR0	Instruction	TDO Output	Notes
0	0	0	EXTEST	Boundary Scan Register	
0	0	1	IDCODE	Identification register	2
0	1	0	SAMPLE-Z	Boundary Scan Register	1
0	1	1	RESERVED	Do Not Use	5
1	0	0	SAMPLE/PRELOAD	Boundary Scan register	4
1	0	1	RESERVED	Do Not Use	5
1	1	0	RESERVED	Do Not Use	5
1	1	1	BYPASS	Bypass Register	3

6109tbl 13

NOTES:

1. Places Qs in Hi-Z in order to sample all input data regardless of other SRAM inputs.
2. TDI is sampled as an input to the first ID register to allow for the serial shift of the external TDI data.
3. Bypass register is initialized to Vss when BYPASS instruction is invoked. The Bypass Register also holds serially loaded TDI when exiting the Shift DR states.
4. SAMPLE instruction does not place output pins in Hi-Z.
5. This instruction is reserved for future use.

JTAG Timing Diagram

6109 drw 19

Technical drawing of a 13.0 x 15.0 mm body package outline. The drawing includes a top view, a side view, and a cross-section view. The top view shows a rectangular package with a grid of 165 balls (15 rows by 11 columns). Dimensions include a 1.0 mm pitch for the balls, a 1.0 mm pitch for the package body, and a 1.0 mm pitch for the package body. The side view shows the package height and the ball pitch. The cross-section view shows the package body and the ball pitch. The drawing is labeled with 'PSC-4086' and '13.0 X 15.0 MM BODY'.

Revision History

<u>REVISION</u>	<u>DATE</u>	<u>PAGES</u>	<u>DESCRIPTION</u>
0	8/01/03	1-21	Initial Advance Information Data Sheet Release
A	11/14/03	11,12,19	Updated t _{KHKH} (max) for 167-250 MHz and set-up & hold times for 250MHz. Incorporated 133 MHz speed grade in S167 speed bin.
		15	Changed number of Boundary Scan bits from 109 to 107. Specified ID bits [28:24] and IDT JEDEC ID bits [11:1] in binary.
		16	Updated Boundary Scan Pin IDs for order #48, #64 and #84 through 107.
B	3/30/04	1,3,5-8,14-15	Renamed address inputs from A to SA.
		5-8	Identified 36Mb to 288Mb address expansion pins and requirements.
		9	Updated absolute maximum V _{TERM} on input terminals, added V _{DDQ} requirement note 2 and V _{REF} min/max specifications
		9,11,12	Consolidated DC and AC input specifications by adding new pg.12, including new Input Electrical Characteristics table, notes 1-5 and overshoot/undershoot timing diagrams.
		10	Updated application example showing HSTL terminations (R and V _T) on control inputs.
		11	Clarified V _{OH} , V _{OL} , I _{DD} and I _{SB1} test conditions and notes.
		13	Clarified t _{KHKL} , t _{KLKH} , t _{KH\bar{K}H} , t \bar{K} HKH as a percentage of the cycle time; updated t _{KC} var cycle to cycle period jitter and notes for AC Electrical Characteristics.
		14	Added t _{CQHGX} to timing diagram.
		17,18	Modified Boundary Scan order for x8 and x9 options, adding new page 17 with new pin IDs for order#64, #72-75, #80-83, #88-91 and #96-99; changed order #48 from 10A to Internal for x8/9 and x18/36 options.
C	5/18/04	19	Updated JTAG DC Operating Conditions note 1 and V _{OH} (max) specification from V _{DD} to V _{DDQ} . Added t _{CLOV} to JTAG Timing Diagram.
		1	Corrected package size to 13mm x 17mm fBGA.
		2	Clarified data word order.
		12	Updated AC Test Load and Test Conditions to V _{REF} = V _{DDQ} /2.
		15	Clarified pull up resistor to V _{DD} for the unused JTAG inputs.
